Every year, millions of people die from curable diseases, often because they receive medical care too late or not at all. Muso has developed a proactive healthcare model that saves lives by reaching patients early, within hours of the moment they become sick.

Health can’t wait.

Results

94% patients reached in 72 hours
10X difference in child mortality
39% fewer childhood illnesses
Proactive Care: The Muso Model

Proactive Search
Community Health Workers and community members search for patients through door-to-door home visits, to connect them with care early.

Doorstep Care
CHWs provide a package of lifesaving health care services in the home. These include family planning, pregnancy testing, newborn screening, and treatment for children with malaria, diarrhea, and malnutrition.

Rapid-Access Clinics
Muso removes point-of-care fees, builds infrastructure, and trains staff, so that government clinics can provide universal, early access to care.

Muso launched in 2005, serving 100 people. Since then, we’ve grown more than 1,000-fold. We are now expanding to reach a quarter of a million people across nine sites.

Why We’re Different

Community-Led
Muso’s proactive health system taps the power of social networks, community leaders, and the talent of local women. Communities take the lead in creating a lasting change in health outcomes.

Efficient
At scale, we estimate that the Muso system will enable Ministries of Health to provide universal health coverage at a cost of $21 per person, well within the range of health spending of other countries in Sub-Saharan Africa.

Data-Driven
We test what we do and we share what we test. Our model has been developed and refined over the course of a decade of rigorous research, in partnership with the Malian Ministry of Health, Harvard Medical School, and the University of California San Francisco.

Scalable
Our proactive health system is a high-impact model to eliminate preventable deaths in the world’s most vulnerable communities. We design for simplicity, so that our model can be rolled out at scale by Ministries of Health.
